IN THE CLAIMS

Please amend claims 1, 7, 12, 13, 15 and 16 as follows:

1. (Currently Amended) An apparatus for connecting at least one function-extending
module, which is detachably inserted into a module rack, to a base module capable of
reproducing audio/video (AV) data to be communicated between said at least one function-
extending module and the base module, the apparatus comprising:
a detecting unit for detecting the installation of said at least one function-extending
module in the module rack and for generating a detection signal;
a switching unit for connecting the base module to said at least one function-
extending module; and
a control unit for controlling the switching unit so that said at least one function-
extending module is connected to the base module in a daisy-chain fashion according to the
detection signal from the detecting unit;
wherein the base module has a port and each function-extending module has first and
second ports;
wherein the switching unit comprises a first switching part for selectively connecting
the port of the base module to the first port of one function-extending module, and a second
switching part for selectively connecting the second port of said one function-extending
module to the first port of any other function-extending module;

wherein the second switching part comprises \underline{n} switching [[n]] devices, each

switching device corresponding to a given function-extending module, said each switching device comprising a common port and n-1 selection ports, one selection port for each of n-1 other switching devices; and

wherein the common port of said each switching device is connected to the second port of said given function-extending module, and said n-1 selection ports of said each switching device are connected to the first port of [[said]] n-1 other switching devices function-extending modules, respectively.

- 2. (Previously Presented) The apparatus of claim 1, wherein the port of the base module comprises an IEEE 1394 port and said first and second ports of said each function-extending module are IEEE 1394 ports
- 3. (Previously Presented) The apparatus of claim 1, wherein the detecting unit sends the detection signal to the control unit, the detection signal indicating whether a corresponding function-extending module is inserted into the module rack, said control unit generating a control signal; and

wherein the first switching part selectively connects the port of the base module to the first port of said one function-extending module in response to the control signal generated by the control unit.

5. (Previously Presented) The apparatus of claim 1, wherein said each switching device connects one of the selection ports to its common port in response to another control signal generated by the control unit.

- 6. (Original) The apparatus of claim 1, wherein said at least one function-extending module comprises a plurality of function-extending modules, and wherein said switching unit establishes interconnections between respective function-extending modules.
- 7. (Currently Amended) A method for connecting a plurality of function-extending modules, which are detachably inserted into a module rack, to a base module capable of reproducing audio/video (AV) data to be communicated, the method comprising the steps of:
- (a) providing a switching unit having a first port connected to the base module, <u>said</u> switching unit including a plurality of <u>common ports</u> switching <u>devices</u>, one for each function-extending module, <u>each switching device having a common port</u> and a plurality of <u>additional selection ports</u>;
- (b) connecting [[each]] the common port of [[the]] each switching [[unit]] device to a first port of a respective one of said function-extending modules;
- (c) connecting each additional selection port of [[the]] said each switching [[unit]]

 device to a second port of a corresponding one of said function-extending modules other than

 said respective one of said function-extending modules;

14	(d) detecting whether said function-extending modules are inserted into the module
15	rack; and
16	(e) connecting the detected said function-extending modules to the base module.
1	8. (Currently Amended) The method of claim 7, wherein step (e) comprises:
2	(e11) checking for presence of a previously installed function-extending module; and
3	(e12) connecting the base module to said at least one function-extending module when
4	the previously installed function-extending module is not present.
1	9. (Previously Presented) The method of claim 7, wherein step (e) comprises:
2	(e21) checking for presence of a previously installed function-extending module; and
3	(e22) connecting the previously installed function-extending module to a newly
4	installed function-extending module and connecting the newly installed function-extending
5	module to the base module when only one previously installed function-extending module
6	is present.
1	10. (Previously Presented) The method of claim 7, wherein step (e) comprises:
2	(e31) checking for presence of previously installed function-extending modules; and
3	(e32) connecting a newly installed function-extending module to a function-extending
.4	module which constitutes a last node of a daisy chain of the previously installed function-
5	extending modules when a number of the previously installed function-extending modules

is at least two, and connecting the newly installed function-extending module to the base module.

- 11. (Previously Presented) The method of claim 7, wherein step (e) further comprises connecting said detected at lease one function-extending module to an installed function-extending module in the daisy-chain fashion.
- 12. (Currently Amended) A recording medium having program codes that connect a newly installed function-extending module, which is detachably inserted into [[the]] a module rack, to a base module capable of reproducing audio/video (AV) data to be communicated, the medium comprising:
- a first program code for detecting whether the <u>newly installed</u> function-extending module is inserted into the module rack; and
- a second program code for connecting <u>a first port of</u> the <u>newly installed</u> function-extending module to a <u>second port of a previously installed</u> function-extending module <u>via</u> <u>a common port of a first switching unit and a selection port of a second switching unit when the <u>newly installed</u> function-extending module is detected as being inserted into the module rack;</u>
 - wherein the second program code comprises:
- a first program code portion for confirming presence of the previously installed function-extending module; and

a second program code portion for connecting the <u>second port of the</u> previously installed function-extending module to [[a]] the first port of the newly installed function-extending module <u>via the common port of the first switching unit and the selection port of the second switching unit</u> when there is only one previously installed function-extending module, and connecting the newly installed function-extending module to the base module.

13. (Currently Amended) The recording medium of claim 12, wherein the second program code further comprises:

a third program code portion for connecting the base module to a first port of the newly installed function-extending module to the base module when the previously installed function-extending module is not present.

Claim 14. (Canceled)

15. (Currently Amended) The recording medium of claim 12, wherein the second program code further comprises:

a third program code portion for connecting [[a]] the first port of the newly installed function-extending module to a second port of a function-extending module that constitutes a last node of a daisy chain of [[the]] previously installed function-extending module modules when a number of the previously installed function extending modules is at least two, and for detachably connecting the newly installed function-extending module to the

base module.

function-extending module is present.

16. (Currently Amended) A method for connecting a plurality of function-extending
modules, which are detachably inserted into a module rack, to a base module capable of
reproducing audio/video (AV) data to be communicated, the method comprising the steps
of:
(a) detecting whether said function-extending modules are inserted into the module
rack; and
(b) connecting the detected said function-extending modules to the base module;
wherein step (b) comprises:
(b21) checking for presence of a previously installed function-extending module; and
(b22) connecting <u>a second port of</u> the previously installed function-extending module
to a first port of a newly installed function-extending module via a common port of a first
switching unit and a selection port of a second switching unit and connecting the newly
installed function-extending module to the base module when only one previously installed
